**Integrated Pest Management in Schools**

- Oftentimes schools prevent infestations by utilizing chemical pesticide use. However, these chemicals are often toxic and can cause serious health issues. **Fortunately, however, they can be easily replaced with safe, low-cost and effective alternatives.**

- Pesticides can cause short and long term health risks. **Exposure can lead to pesticide poisoning, which is under-diagnosed in the U.S.** According to the American Association of Poison Control Centers, about 10,000 children experience pesticide poisoning each year.

- Of the 40 most commonly used pesticides in schools, 28 are known carcinogens, 14 are linked with endocrine disruption, and 26 could lead to adverse reproductive effects.

- Nationally, children between 6-11 years are found to have higher levels of pesticide residue in their bodies than any other group of people.

- Recent research shows the use of RoundUp, a popular pesticide containing glyphosate, is becoming more and more common in schools. The World Health Organization declared in 2015 that glyphosate is a probable carcinogen.

**What is IPM?**

Integrated Pest Management (IPM) revolves around six essential components: monitoring, record-keeping, action levels, prevention, tactics criteria, and evaluation.

**IPM is a program that reduces or eliminates the use of pesticides in order to minimize the toxicity of and exposure to harmful chemicals.**

To learn more about how IPM can be a safer alternative to chemical pesticides, visit the EPA at: [http://www.epa.gov/opp00001/ipm/](http://www.epa.gov/opp00001/ipm/)

**What You Can Do:**

- **Meet with your school’s PTA and administrative office to ask about their IPM policies.**

- PA state regulations require schools to implement IPM plans and alert parents and staff of chemical pesticide application prior to use.

- **Work with your local Parent Teacher Association and school administration office to encourage your school to adopt a “no pesticides” policy for school grounds and help choose safer alternatives for pesticides when pesticides must be used.**

- **Ensure that staff applying pesticides in your school are licensed by the state of PA.** IPM plans often fail because school staff are not properly educated on the purpose and benefits of IPM strategies as opposed to pesticides.

- Contact local environmental/health organizations for help drawing up a cost and benefit plan for IPM policies at your school.
